

Bliss Kennels

Dame: _____

Sire: _____

Litter was born _____, 21

They were given a prophylactic worming treatment of Pyrantel Pamoate at weeks 2, 3, 4 and 6. They were also given a 2nd wormer called Panacur for 3 consecutive days at week 3. 5 days at week 5 and 8 days at week 6.5. Speak to your vet regarding either Sentinel or Interceptor which are once a month broad-spectrum wormers that cover all of the aforementioned. Every month this wormer is recommended, as well as the use of Frontline or Advantix. We no longer endorse the use of oral flea/tick medication since 15-25% of dogs react unfavorably and develop gastrointestinal issues.

The puppies have been on a diet of TLC puppy food... _____ a cup, three times daily. More is fine if the puppy is indicating it wants more. Dampen the food quite well with warm water to make it soft. Note: if your puppy does not do a lot of eating for the first couple of days – do not be alarmed. This can and will happen with some puppies as they adjust to their new surroundings. Make sure they have ample water at all times.

The puppies received their first vaccine on _____. They need another one, 3 weeks from this date and will need their final one, 3 weeks from that date. Rabies after they are 6 months old. That will complete all the shots the puppy needs initially. Depending on where you live you may want to do a Lepto vaccine at 6 months. They will need a vaccine booster like the series of three shots as puppies once a year. The new Lyme's vaccine we highly recommend, but make sure it is the new one, not the *old one*. The new one is 99% effective and cannot be administered until the dog is 6 months old or older.

Also, do not let your vet pressure you and influence you to spay/neuter your dog too young. A female dog must be spayed after her first heat cycle. Do not perform it prior to the first heat or you increase the chances for cancer later in life. Males should be 1-6 years old before neutering.
